Parts List

(1) CAPILLARY STRIP (1) FILL TUBE* (1) WATER LEVEL INDICATOR (1) RESERVOIR

*FILL TUBE consists of 2 sections with cap

Assembly

1. Insert CAPILLARY STRIP into the slot at one end.
2. Push FILL TUBE, open slot down, into the hole at other end. Insert until slot is fully covered (or slightly deeper).
3. Place the RESERVOIR into your planter, and position it so that it is level and the FILL TUBE is close to the planter side. You may need to compress your RESERVOIR from each end and continue compressing it as you wedge it into the planter.
4. Depending on the type of planter you are using, the RESERVOIR can be placed as follows:
 - at the very base of the planter
 - partially raised — add a layer of planting mix then place RESERVOIR on top

Adjust the FILL TUBE to the desired height by twisting the end — it should rise just above the eventual soil line.

5. Place the WATER LEVEL INDICATOR, float end down, into the FILL TUBE and trim it so that it is even with the top of the FILL TUBE. Once the reservoir is filled, the INDICATOR will rise above the top of tube; when the water gets low, it will return to the same level as the tube top — letting you know it's time to refill the RESERVOIR.
6. Add a layer of pre-moistened planting mix, place the CAPILLARY STRIP over the mix, and continue filling the container. Keep the RESERVOIR level as you fill your planter. (You may need to hold the RESERVOIR level and pack the planting mix on and around it to keep it level.)
7. Fill the RESERVOIR via the FILL TUBE until the WATER LEVEL INDICATOR stops rising.
7. Water the soil from the top after planting until plant roots are settled and soil stays moist on its own. Fill the WATER RESERVOIR when the WATER LEVEL INDICATOR is even with the top of the FILL TUBE.

To prevent damage, we recommend emptying, cleaning, and storing your containers and reservoirs indoors or under cover before freezing weather sets in or when the container is not in use.
