# WAXED AMARYLLIS CARE

This premium amaryllis bulb needs no planting or watering – the wax coating holds all the stored energy and water it needs to grow and bloom!

Simply place the bulb on any flat surface — a coiled wire embedded in the wax makes it freestanding — taking care to protect surfaces from scratches and wax smears. You can also place the bulb in a clear vase, nestle it among pebbles, mini string lights, and other holiday decorations, or grow it upside down with our innovative brass hanger (sold separately). For best results, place it in a location that gets bright, indirect light.

Shoots will soon begin to emerge from the bulb. In approximately four to six weeks its stunning flowers will begin to bloom. No fertilizing or staking is needed, but rotate the bulb every few days to keep the flower stems growing straight. You can expect one or two flower stalks, each with up to four blooms.

**NOTE:** *Growth cracks may appear in the wax coating as the plant grows. Once it has finished flowering, you can discard the bulb or peel off the wax and, if the bulb is still firm, try to rebloom it next season. Visit [gardeners.com](https://www.gardeners.com) for more information on amaryllis care and reblooming.*

## Stages of Growth
