

Mammoth Tomato Towers, set of 2

Mammoth Tomato Towers are the perfect supports for growing your larger, heavier plants. They are made from sturdy powder-coated steel and have an open design to make harvesting easier.

Parts List

(4) Upper Panels

(4) Lower Panels

Assembly and Installation

We recommend installing the Mammoth Tomato Towers at planting time, when the plants are still small, to avoid damaging roots and stems later in the season. For ease of installation, loosen the soil to a depth of 8" to 12", especially in stony or heavy soil.

Step 1. Identify the 4 Upper Panels by finding the Panels with the Receptacles (Figure 1). Attach them together by sliding the hooks on one Panel into the loops on another Panel, forming a square (Figure 2). Repeat to attach the Lower Panels together.

Step 2. Position the Lower Panels where you want your Tomato Cage and press the lower legs firmly into the soil. Place the Upper Panels on top of the Lower Panels, guiding the upper half's receptacles over the short wires at each corner of the Lower Panels (Figure 1).

The powder-coated steel is weather-resistant. However if the finish is nicked or scratched, use an exterior-grade metal paint to prevent rust. For greater stability, especially in windy areas, we recommend attaching each Tower to a sturdy stake or anchoring it with Earth Staples (sold separately).
