# AMARYLLIS CARE

The magnificent flowers of this premium amaryllis will brighten your home for weeks!

## Care

- Upon its arrival, water thoroughly and place the pot in bright light at room temperature (65–75° F).
- Water as needed to keep the soil moist but not wet.
- Avoid getting water in the bulb's neck. Empty any water that has drained into the outer pot.
- Rotate the pot every few days to keep the plant growing straight.
- When the buds start to open, insert the brass support stake into the soil and then rotate the loop around the flower stalk.
- Move the plant to a cool spot (55–65° F) out of direct sunlight to prolong blooming.

## Re-Blooming

After flowering, allow the plant to continue growing until late summer. Then, stop watering and, when foliage dries, cut leaves back to approximately 2" above bulb top. Let the bulb rest in a cool, dark, dry place for at least eight weeks. Then, repeat the above care.

For more details, read our "Amaryllis Care" article at [gardeners.com](http://gardeners.com).

## Stages of Growth
