### Installation Steps

1. Connect the Pressure Regulator (A) to the faucet.  
   Option: Use the Hose Quick Connector (B) to connect the system to a garden hose as shown in the diagram.
2. Attach the Snap-On Connector(C) of the Supply Pipe (D) to the Pressure Regulator (A) outlet.
3. Lay the Supply Pipe (D) as shown in the diagram and place it in the planters.
4. Firmly fix the Drippers (E) in place. Connect the dripper inlet to the nearest T-adaptor (G).
5. Block the end of the T-adaptor (H) outlet with Plug (F).
6. Make sure that all fittings have been firmly attached, turn on the faucet and begin watering.

### Maintenance:

- Once a year, remove the end Plugs (F), flush with water and drain.
- It is recommended to rinse the filter once a month to clear any debris and to prevent clogging.
Winterization the Planters Dripper Kit

Winterizing your **Planters Dripper Kit** is fast and easy when you follow these simple steps.

In general, though the polyethylene tubing found on most micro irrigation systems has the ability to expand and contract, winterizing your system is necessary to protect the hard plastic and metal components that are normally present.

**Winterizing steps:**

1. Shut off the main water supply and remove the faucet assembly (timer, filter, pressure regulator, etc.) at the start of the system.
   
   These components should be drained and brought indoors to protect them from freezing.

2. Remove the 4mm tube start adaptor and the garden hose quick connector from the pressure regulator according to the image.

3. Remove all end fittings to drain the irrigation system. Slightly elevate the lines to make sure they are drained.

4. After the lines have drained, make sure to replace all end fittings. The beginning of the system where the faucet assembly was removed should be sealed off as well.

5. When restarting the system for the new growing season make sure to tighten all end caps and check for leaks or any damage that may have occurred over winter.
