Bean Tower

The Bean Tower is 76" tall and provides sturdy support for pole beans, climbing peas, tomato plants and other vegetables. We recommend installing the Bean Tower at planting time because the plants will search for support as soon as they emerge from the soil.

Assembly

**Step 1.** For ease of installation, loosen the soil to a depth of 8” to 12”, especially in stony or heavy soil.

**Step 2.** Position the lower half of the Bean Tower where you want it and press the lower legs firmly into the soil. Place the upper half of the Tower on top of the lower part, guiding the receptacles over the short wires at all corners. For greater stability, especially in windy areas, we recommend anchoring it with optional Earth Staples or attaching it to a sturdy stake.

If the powder-coated finished is nicked or scratched, touch it up with exterior paint or polyurethane to prevent rust.
